---

The Phazer Area Controller is pre-wired for use with a normally open, resisted alarm circuit using a 1 K Ohm resistor. When using the Phazer with a different alarm panel that does NOT look for a 1 K resistor, you must cut R12 off the Phazer board and wire the correct resistor across the C (common) and the NO (normally open) contacts. Cutting R12 off the board is not required when using the C and NC contacts (closed circuit).
